

# Gravitational Potential of a Sphere

# E

Figure E.1 shows a point mass  $m$  with Cartesian coordinates  $(x, y, z)$  as well a system of  $N$  point masses  $m_1, m_2, m_3, \dots, m_N$ . The  $i$ th one of these particles has mass  $m_i$  and coordinates  $(x_i, y_i, z_i)$ . The total mass of the  $N$  particles is  $M$ ,

$$M = \sum_{i=1}^N m_i \quad (\text{E.1})$$

The position vector drawn from  $m_i$  to  $m$  is  $\mathbf{r}_i$  and the unit vector in the direction of  $\mathbf{r}_i$  is

$$\hat{\mathbf{u}}_i = \frac{\mathbf{r}_i}{r_i}$$

The gravitational force exerted on  $m$  by  $m_i$  is opposite in direction to  $\mathbf{r}_i$ , and is given by

$$\mathbf{F}_i = -\frac{Gmm_i}{r_i^2} \hat{\mathbf{u}}_i = -\frac{Gmm_i}{r_i^3} \mathbf{r}_i$$

**FIGURE E.1**

A System of Point Masses and a Neighboring Test Mass  $m$ .

## 734 Gravitational Potential of a Sphere

The potential energy of this force is

$$V_i = -G \frac{mm_i}{r_i} \quad (\text{E.2})$$

The total gravitational potential energy of the system due to the gravitational attraction of all of the  $N$  particles is

$$V = \sum_{i=1}^N V_i \quad (\text{E.3})$$

Therefore, the total force of gravity  $\mathbf{F}$  on the mass  $m$  is

$$\mathbf{F} = -\nabla V = -\left( \frac{\partial V}{\partial x} \hat{\mathbf{i}} + \frac{\partial V}{\partial y} \hat{\mathbf{j}} + \frac{\partial V}{\partial z} \hat{\mathbf{k}} \right) \quad (\text{E.4})$$

Consider the solid sphere of mass  $M$  and radius  $R_0$  illustrated in Figure E.2. Instead of a discrete system as above, we have a continuum with mass density  $\rho$ . Each “particle” is a differential element  $dM = \rho dv$  of the total mass  $M$ . Equation (E.1) becomes

$$M = \iiint_v \rho dv \quad (\text{E.5})$$

where  $dv$  is the volume element and  $v$  is the total volume of the sphere. In this case, Eqn (E.2) becomes

$$dV = -G \frac{mdM}{r} = -Gm \frac{\rho dv}{r}$$

**FIGURE E.2**

Sphere with a Spherically Symmetric Mass Distribution.

where  $r$  is the distance from the differential mass  $dM$  to the finite point mass  $m$ . Equation (E.3) is replaced by

$$V = -Gm \iiint_V \frac{\rho dv}{r} \quad (\text{E.6})$$

Let the mass of the sphere have a spherically symmetric distribution, which means that the mass density  $\rho$  depends only on  $r'$ , the distance from the center  $C$  of the sphere. An element of mass  $dM$  has spherical coordinates  $(r', \theta, \phi)$ , where the angle  $\theta$  is measured in the  $xy$  plane of a Cartesian coordinate system with origin at  $C$ , as shown in Figure E.2. In spherical coordinates the volume element is

$$dv = r'^2 \sin \phi d\phi dr' d\theta \quad (\text{E.7})$$

Therefore Eqn (E.5) becomes

$$\begin{aligned} M &= \int_{\theta=0}^{2\pi} \int_{r'=0}^{R_0} \int_{\phi=0}^{\pi} \rho r'^2 \sin \phi d\phi dr' d\theta = \left( \int_0^{2\pi} d\theta \right) \left( \int_0^{\pi} \sin \phi d\phi \right) \left( \int_0^{R_0} \rho r'^2 dr' \right) \\ &= (2\pi)(2) \left( \int_0^{R_0} \rho r'^2 dr' \right) \end{aligned}$$

so that the mass of the sphere is given by

$$M = 4\pi \int_{r'=0}^{R_0} \rho r'^2 dr' \quad (\text{E.8})$$

Substituting Eqn (E.7) into Eqn (E.6) yields

$$V = -Gm \int_{\theta=0}^{2\pi} \int_{r'=0}^{R_0} \int_{\phi=0}^{\pi} \frac{\rho r'^2 \sin \phi d\phi dr' d\theta}{r} = -2\pi Gm \left[ \int_0^{R_0} \left( \int_0^{\pi} \frac{\sin \phi d\phi}{r} \right) \rho r'^2 dr' \right] \quad (\text{E.9})$$

The distance  $r$  is found by using the law of cosines,

$$r = (R^2 + r'^2 - 2r'R \cos \phi)^{\frac{1}{2}}$$

where  $R$  is the distance from the center of the sphere to the mass  $m$ . Differentiating this equation with respect to  $\phi$ , holding  $r'$  constant, yields

$$\frac{dr}{d\phi} = \frac{1}{2} (R^2 + r'^2 - 2r'R \cos \phi)^{-\frac{1}{2}} (2r'R \sin \phi) = \frac{r'R \sin \phi}{r}$$

so that

$$\sin \phi d\phi = \frac{r dr}{r'R}$$

It follows that

$$\int_{\phi=0}^{\pi} \frac{\sin \phi d\phi}{r} = \frac{1}{r'R} \int_{R-r'}^{R+r'} dr = \frac{2}{R}$$

Substituting this result along with Eqn (E.8) into Eqn (E.9) yields

$$V = -\frac{GMm}{R} \quad (\text{E.10})$$

We conclude that the gravitational potential energy, and hence (from Eqn (E.4)) the gravitational force, of a sphere with a spherically symmetric mass distribution  $M$  is the same as that of a point mass  $M$  located at the center of the sphere.
